# Estudio no estacionario de clima medio de oleaje en la costa central de Chile

**Mauricio Molina Pereira**

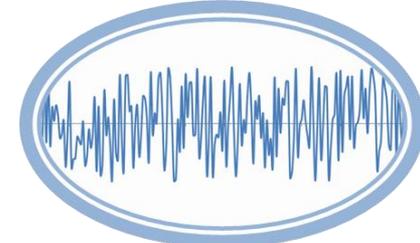

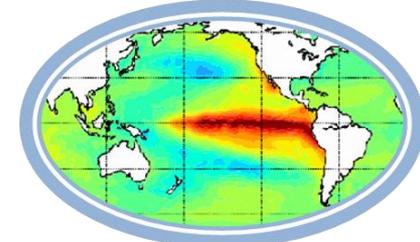

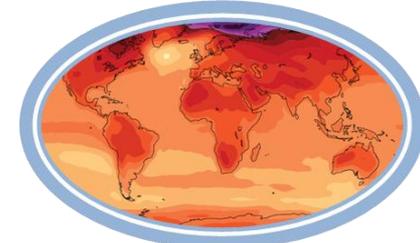

Licenciado en ciencias de la ingeniería

Diplomado en ingeniería Marítima

# Contenidos

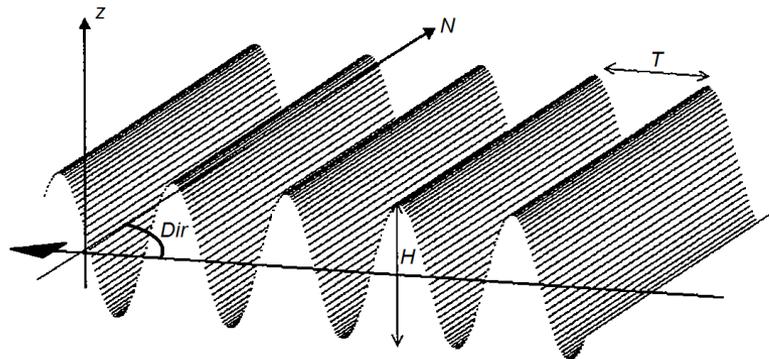

- Introducción
- El oleaje en la ingeniería marítima
- La condición estacionaria
- El Calentamiento Global
- El Niño - Oscilación Sur (ENOS)
- Influencias en el viento
- Estudio de oleaje no estacionario
- Resultados: Influencias en el oleaje
- Pronóstico de oleaje a 25 años
- Conclusiones
- Recomendaciones

# El oleaje en la costa

# El Oleaje

## en la ingeniería marítima

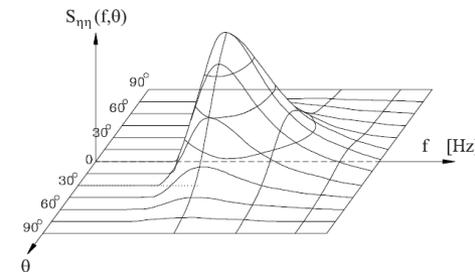

# El Oleaje en la ingeniería marítima

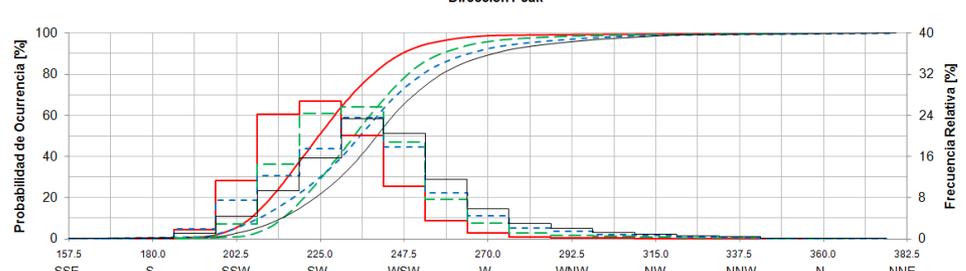

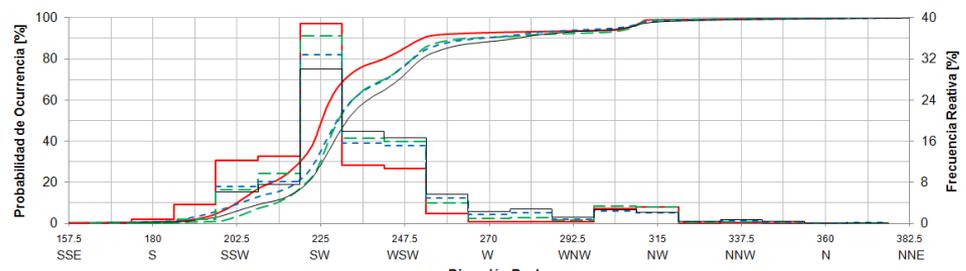

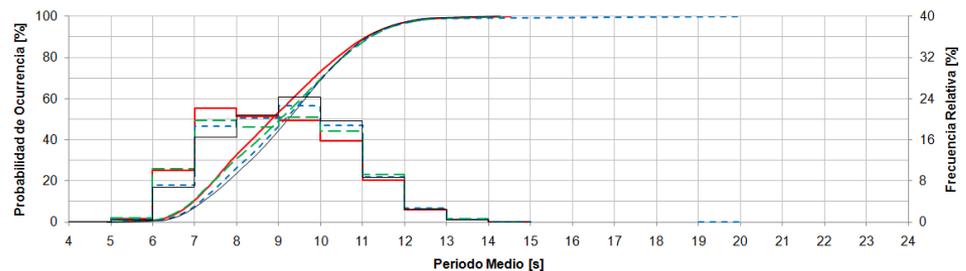

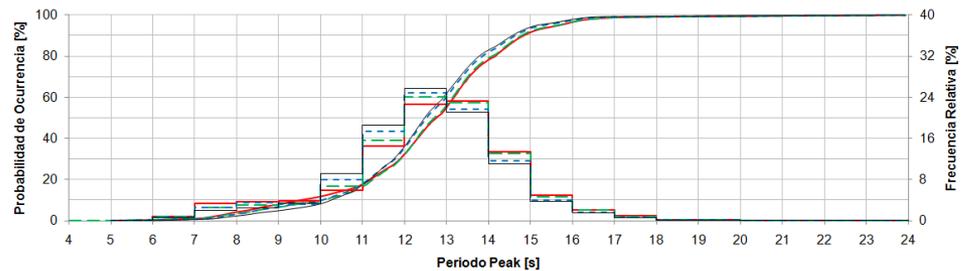

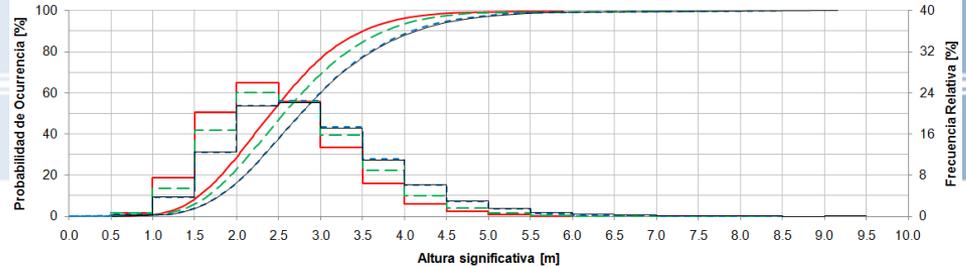

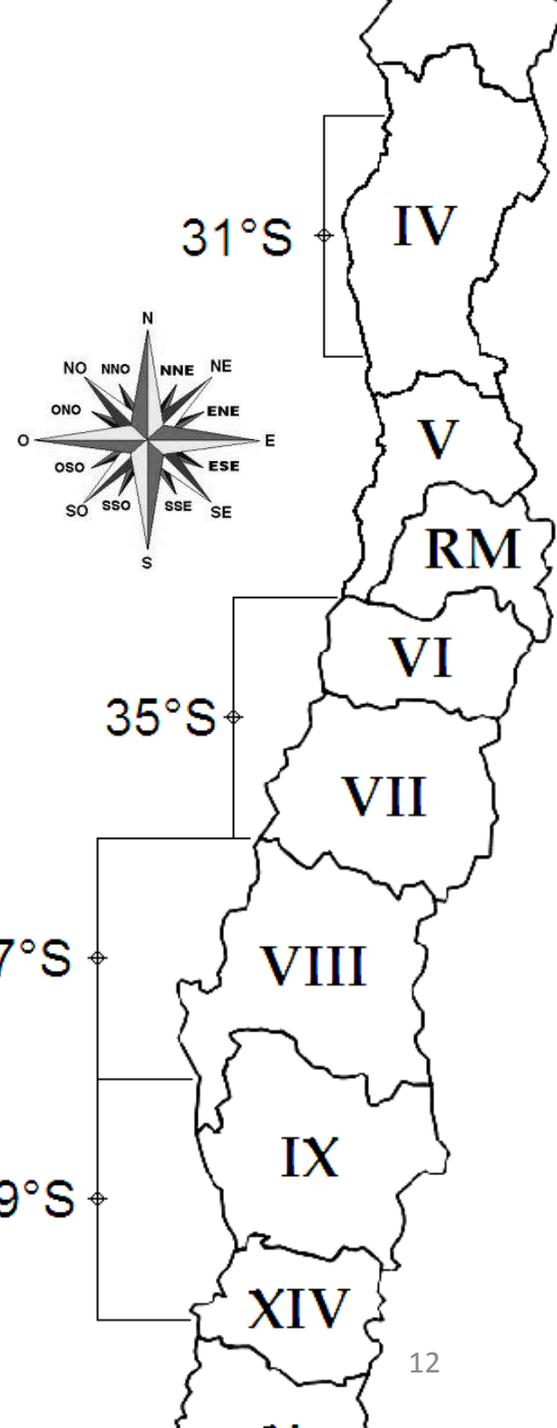

## Estadística disponible

- La estadística de oleaje fue cedida gentilmente por HydroChile
- Consta de 20 años de información de parámetros de resumen espectral
- Estadística de un modelo de hindcasting de oleaje
- Estadística de cuatro nodos

— Nodo 31    - - - Nodo 35    - · - · Nodo 37    — Nodo 39

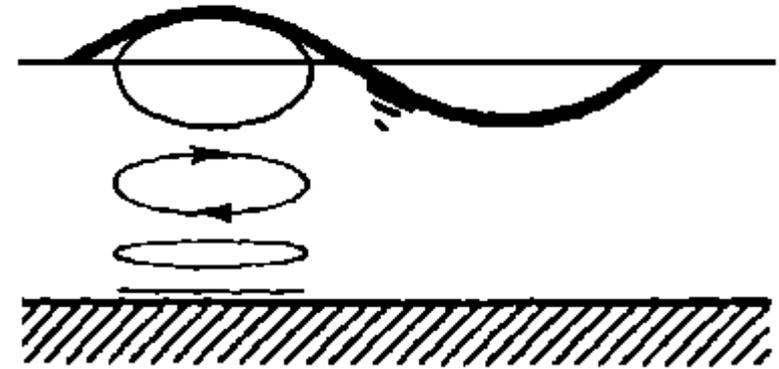

## La representación de la realidad

- Todo fenómeno requiere de una aproximación, que no siempre es totalmente satisfactoria

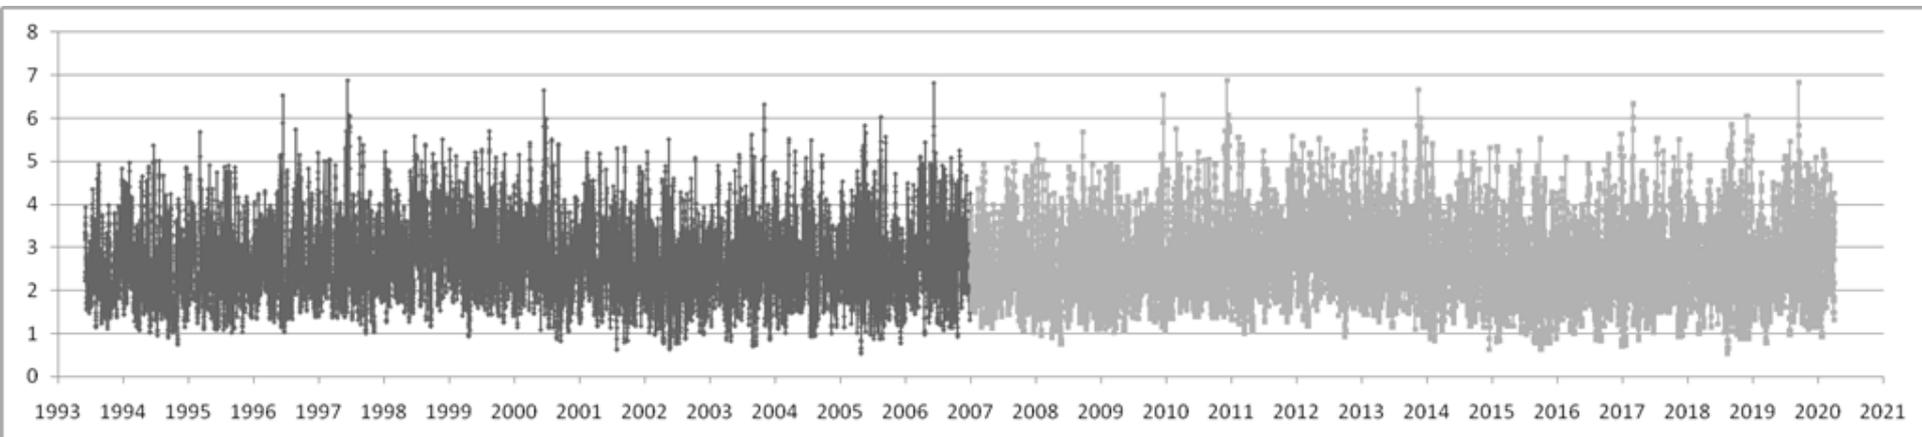

# La condición Estacionaria

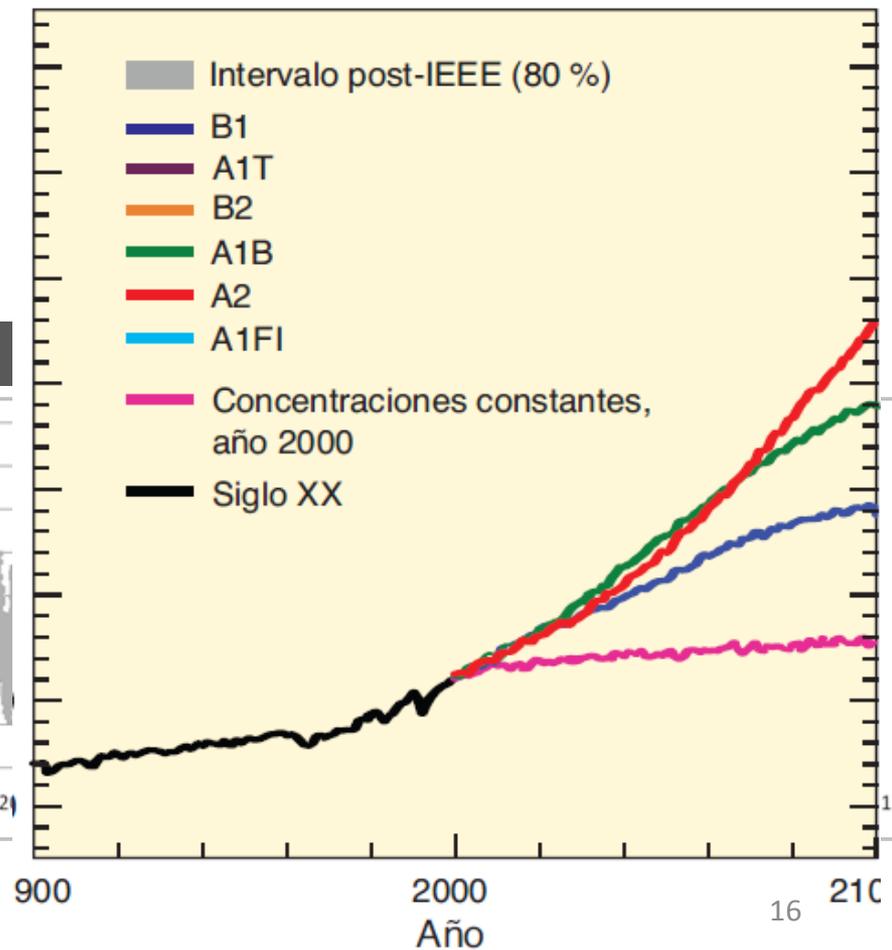

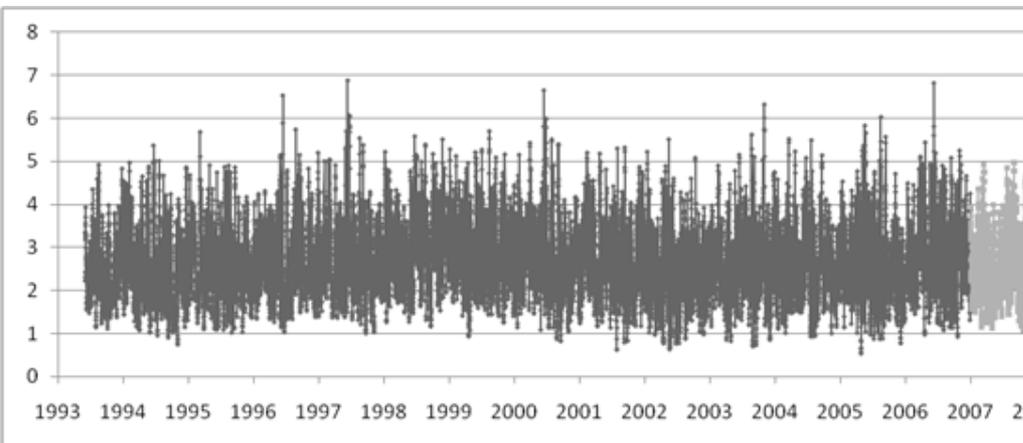

- En ingeniería marítima se supone al oleaje estacionario
  - Estadística pasada es representativa de la condición futura

Vida útil de un proyecto

- ¿Sigue siendo válido el supuesto a la luz del Calentamiento Global?

- En términos estrictos, Parzen (1999) se señala que:

*“...un proceso estacionario es aquel cuya distribución sigue siendo la misma con el paso del tiempo... lo cual ocurre cuando se cumple:*

*$E (Y_t) = m$ , o media constante,*

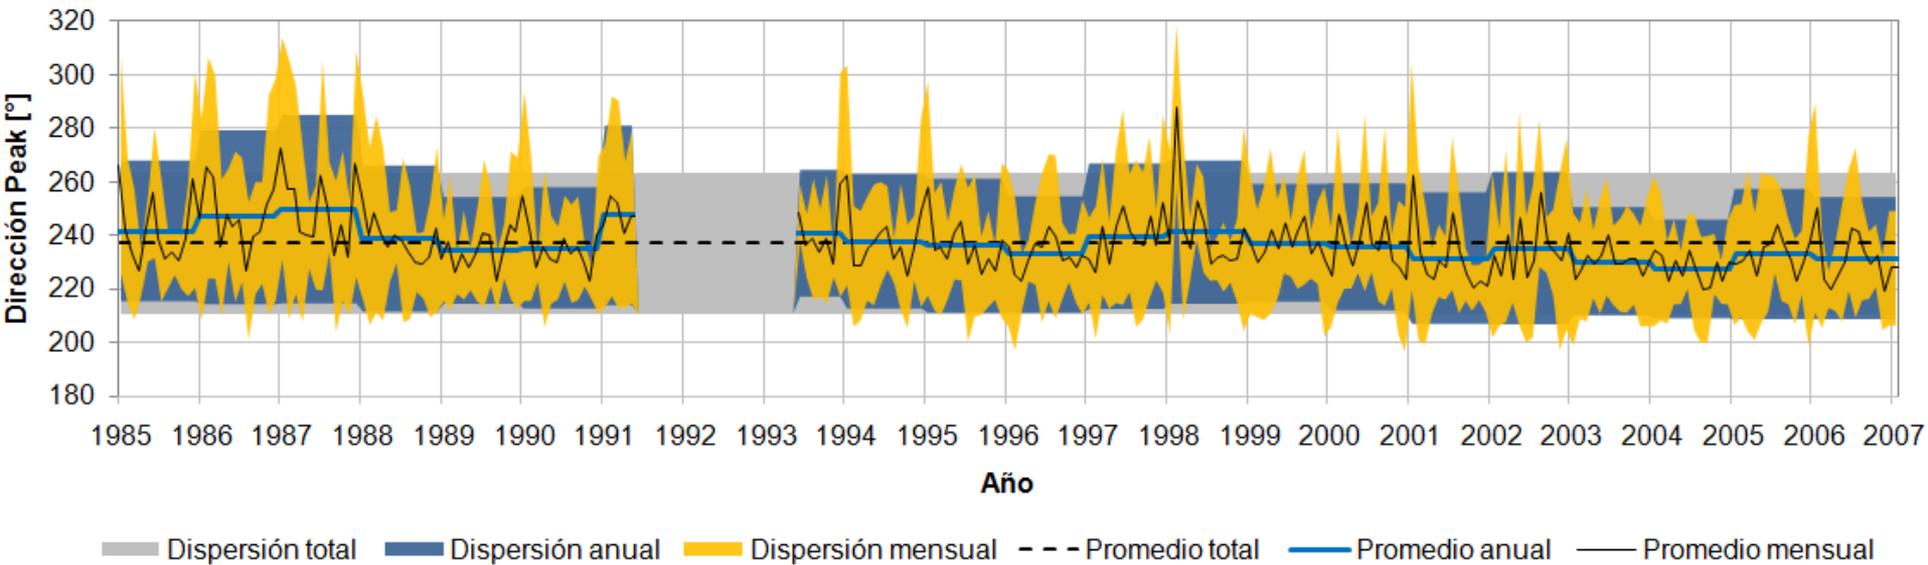

*$Var (Y_t) = E (Y_t - m)^2 = s^2$ , o varianza constante, y*

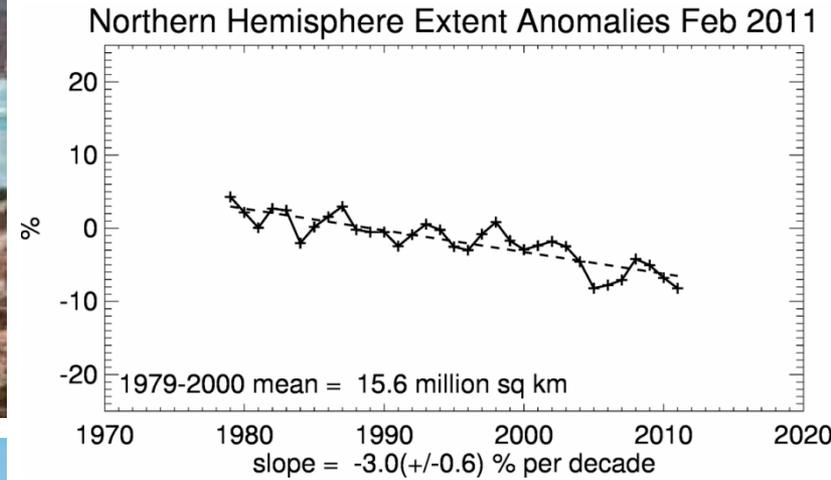

*$Cov (Y_t; Y_{t-j}) = Cov (Y_{t+m}; Y_{t+m-j})$ , o covarianza constante.”*

- Una pequeña verificación de la estadística...

Anomalía anual de la superficie de hielo en el polo norte

# Condicionantes de un proyecto de obras marítimas

# Estudio de oleaje

## No Estacionario

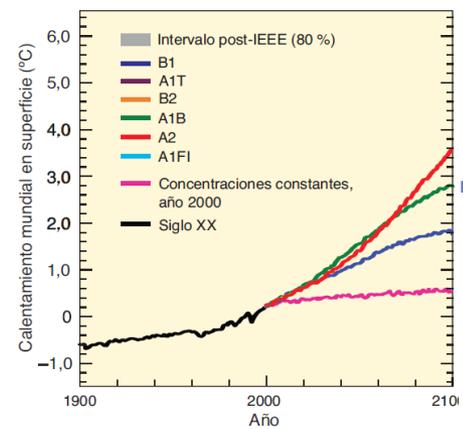

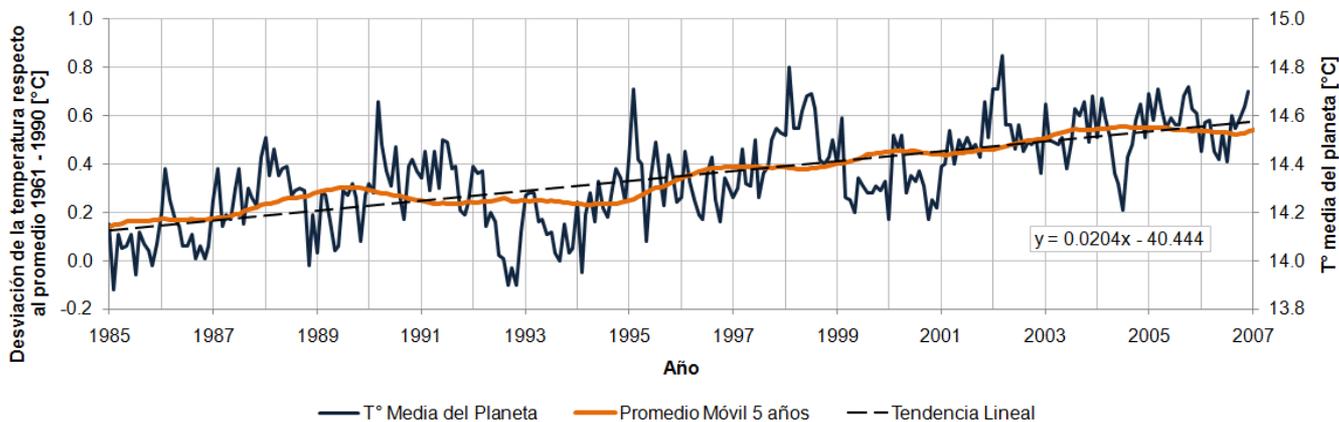

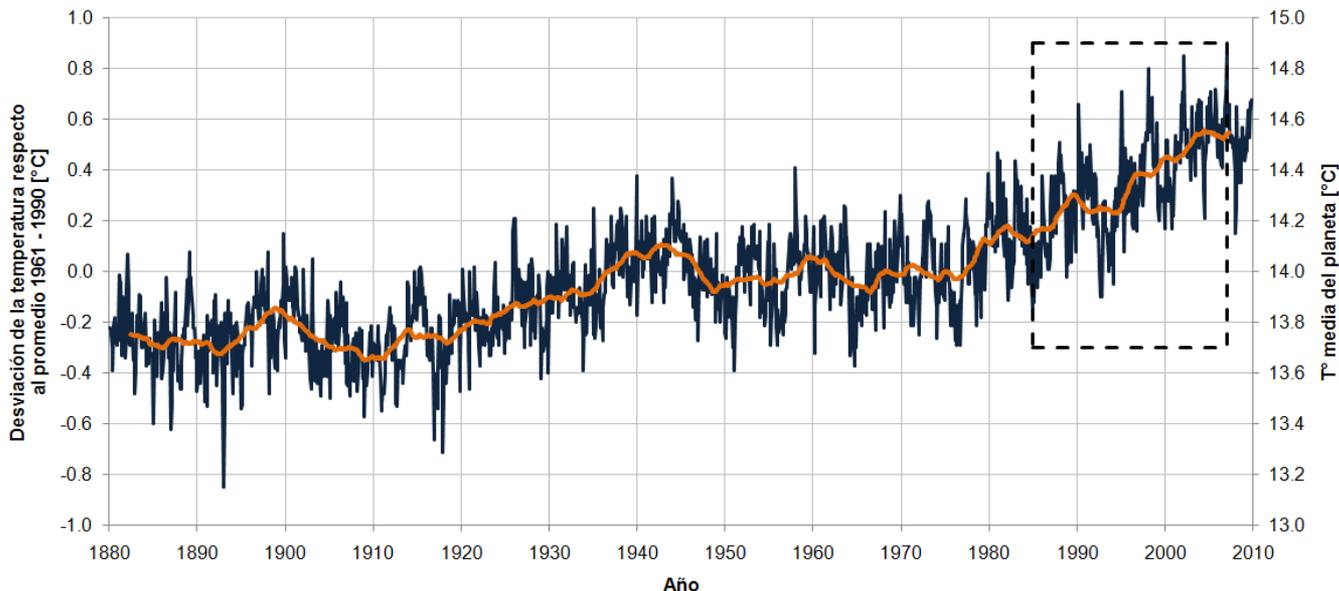

- Considerando que:
  - La estadística de oleaje no cumple los criterios para una serie estacionaria.
  - El viento que genera el oleaje es influenciado por ENOS y Calentamiento Global
- Entonces:
  - Se plantea el desarrollo de un estudio de oleaje que incorpore las influencias de ENOS y Calentamiento Global

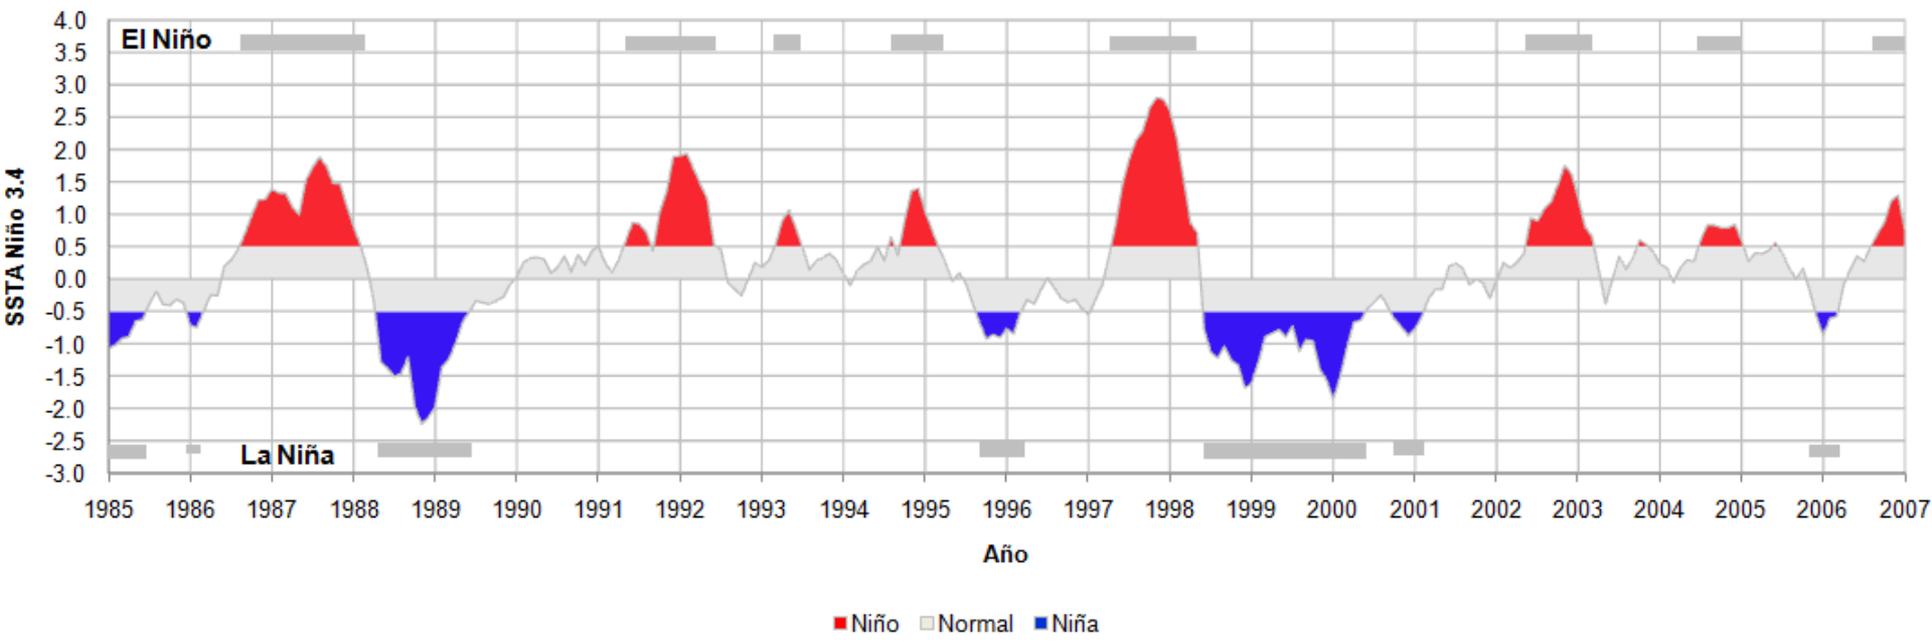

# Calentamiento Global como tendencia lineal

# ENOS como ciclo irregular

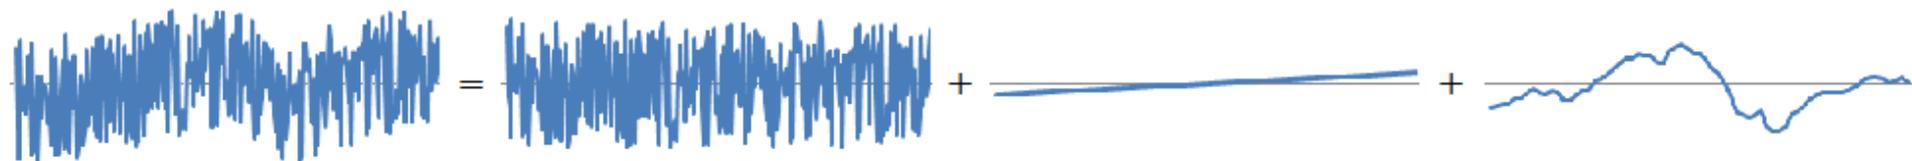

# Modelo aditivo

- El oleaje puede ser definido según el modelo aditivo

*Oleaje real (no estacionario)* = *Oleaje (estacionario)* + *Tendencia (Calentamiento Global)* + *Ciclo (ENOS)*

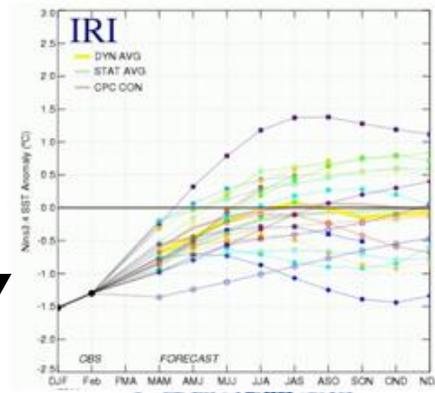

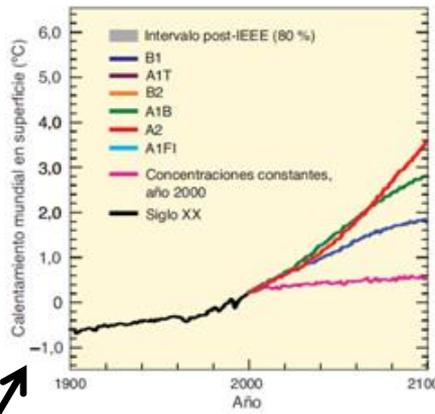

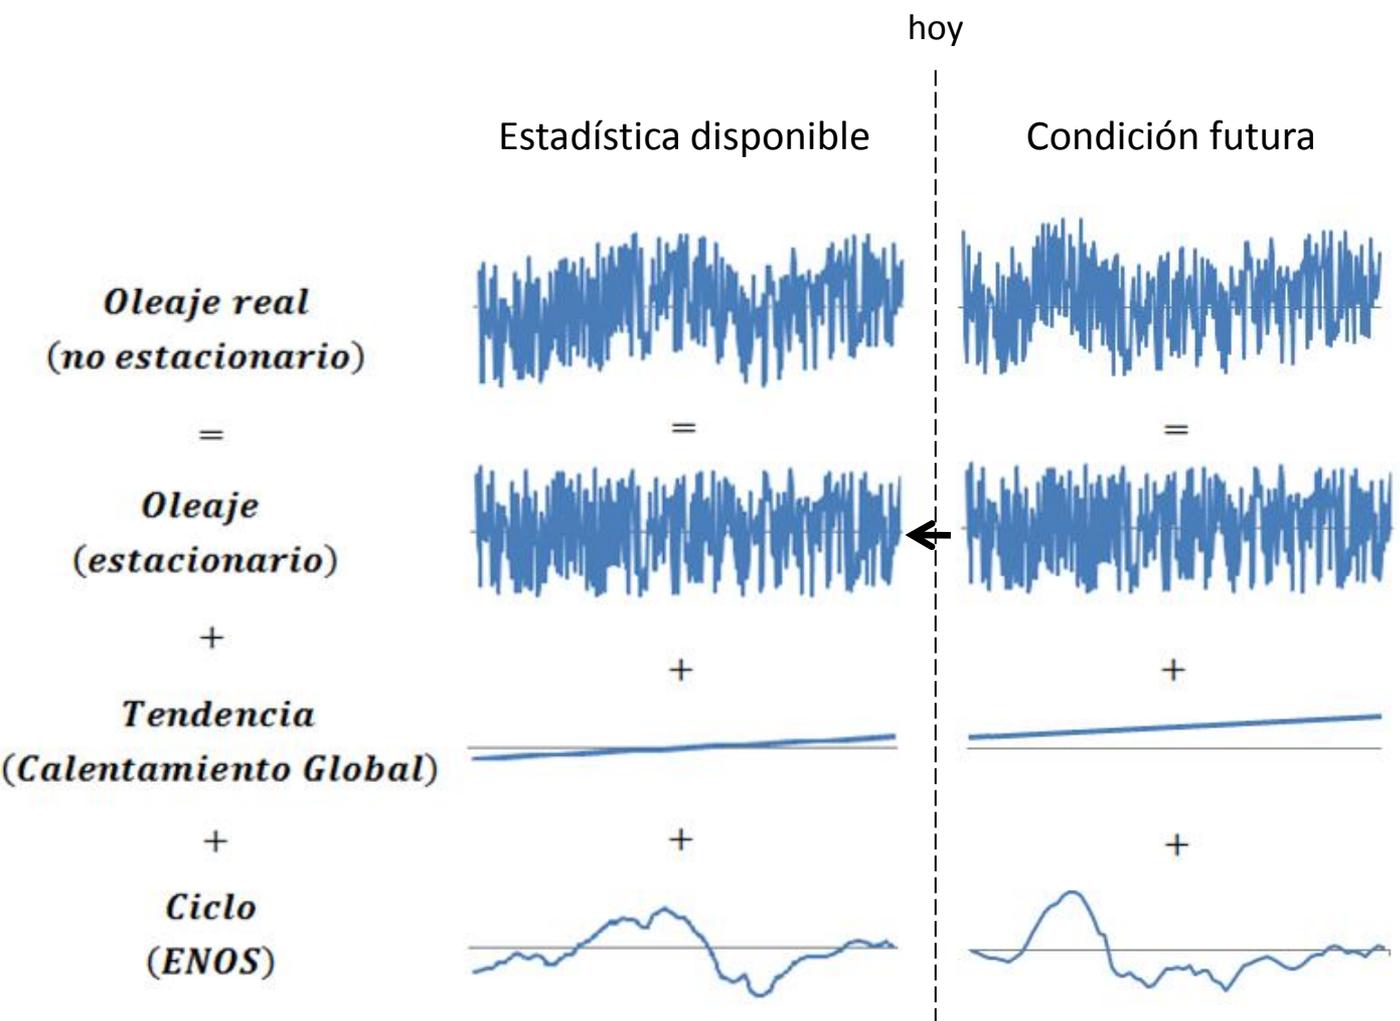

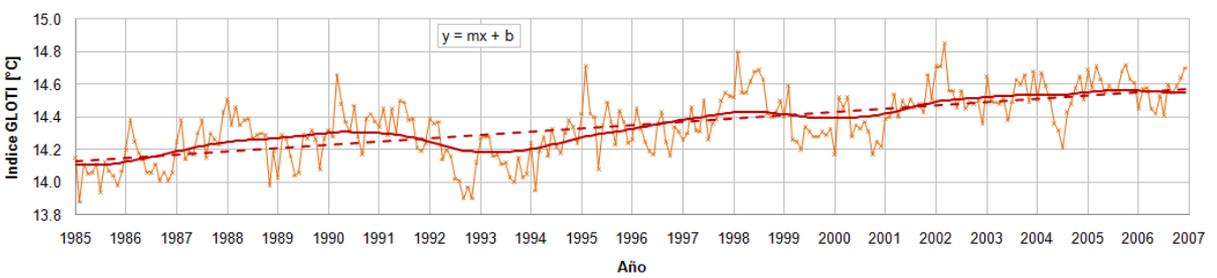

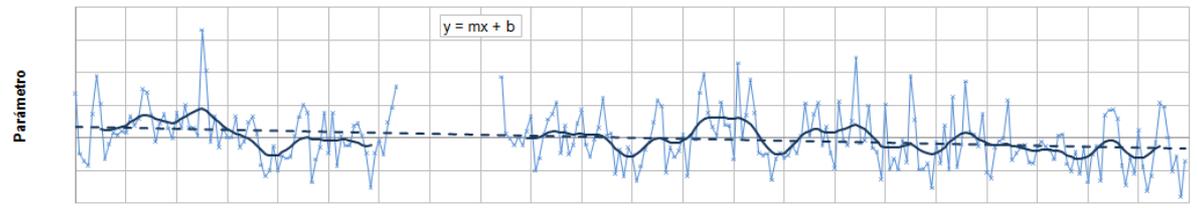

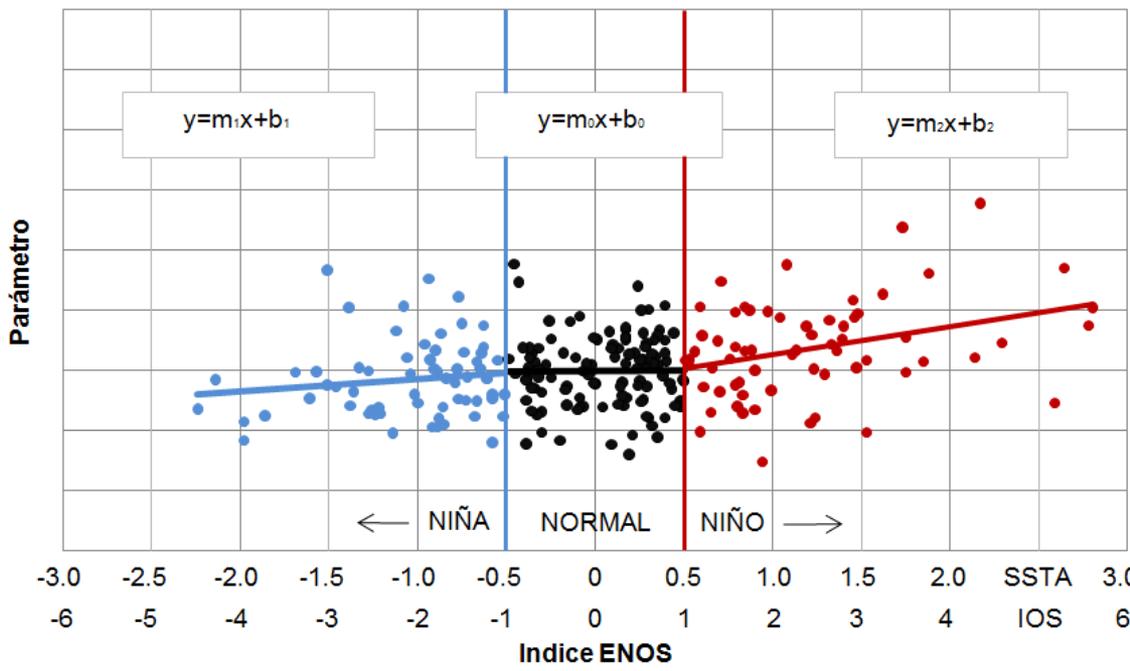

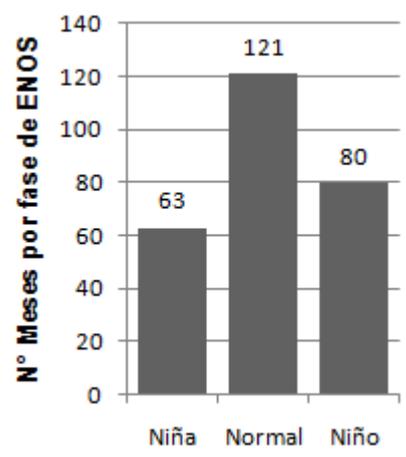

*Oleaje (estacionario)* = *Oleaje real (no estacionario)* - *Tendencia (Calentamiento Global)* - *Ciclo (ENOS)*

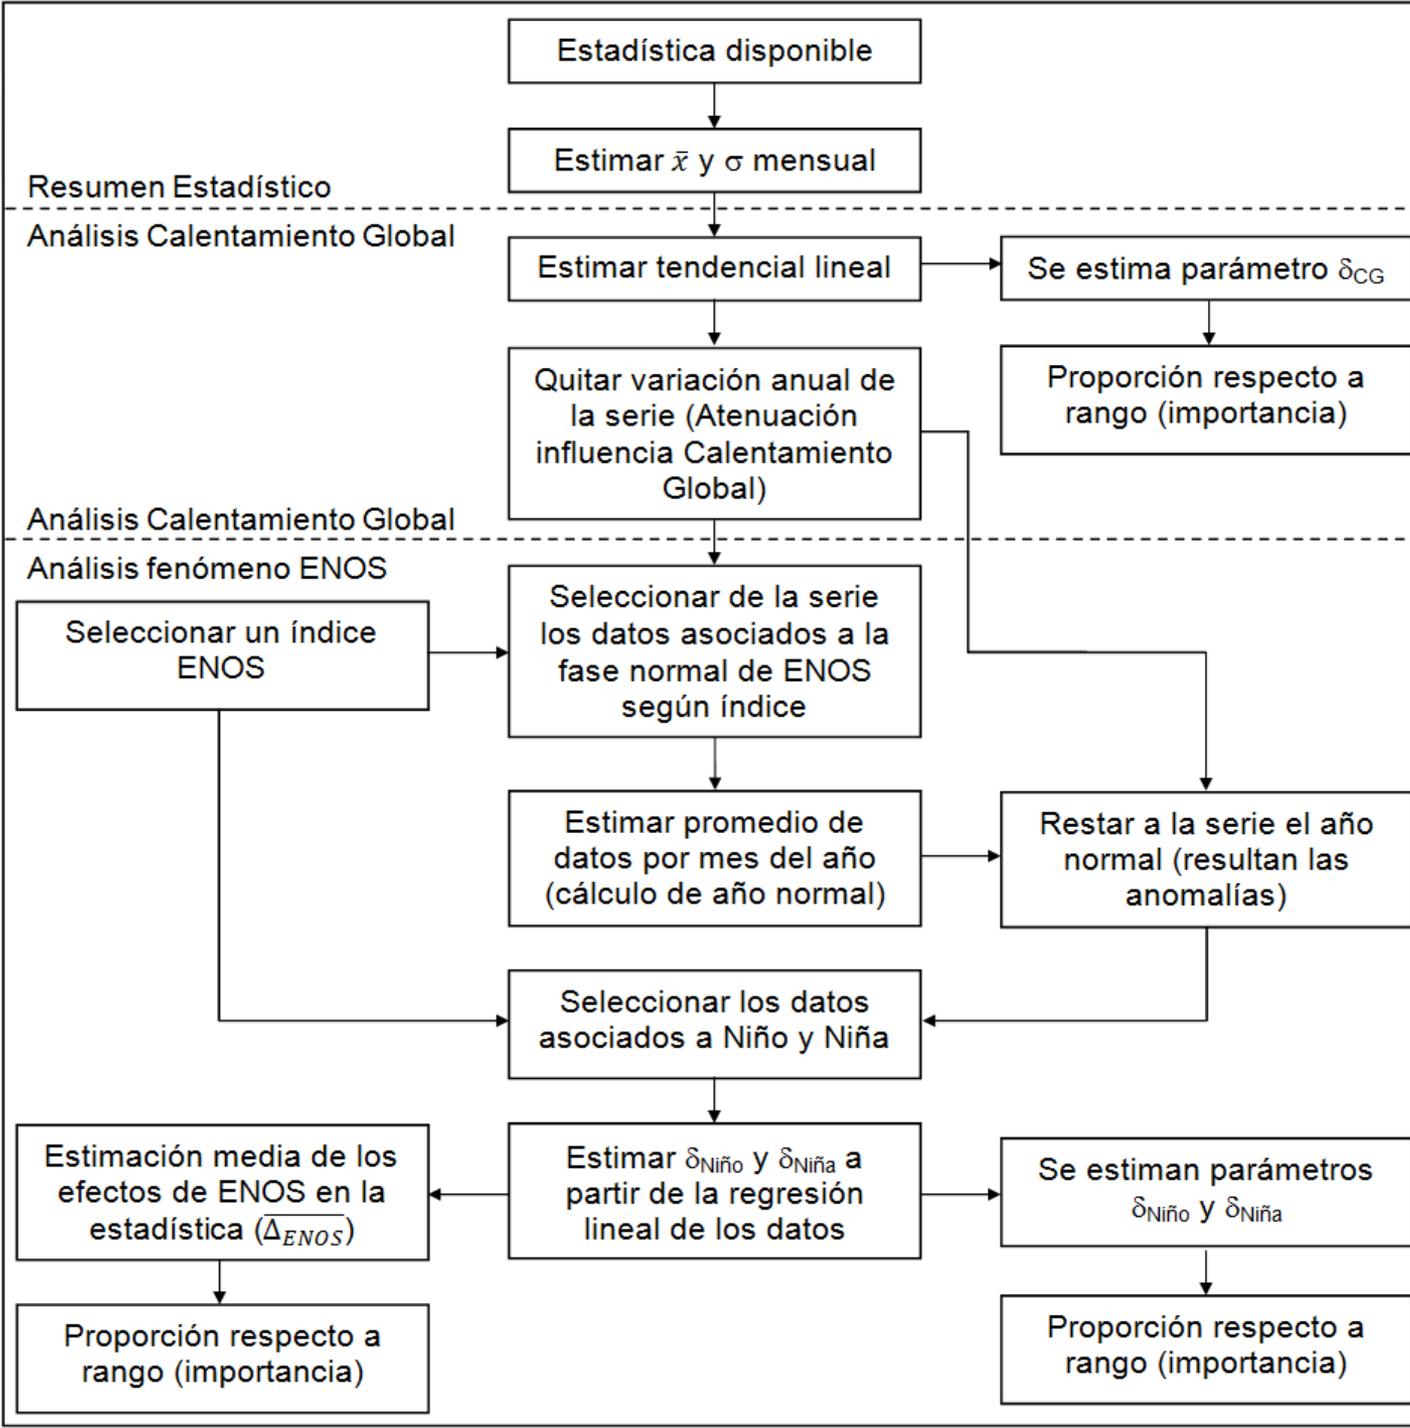

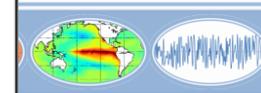

# Mejora en los pronósticos

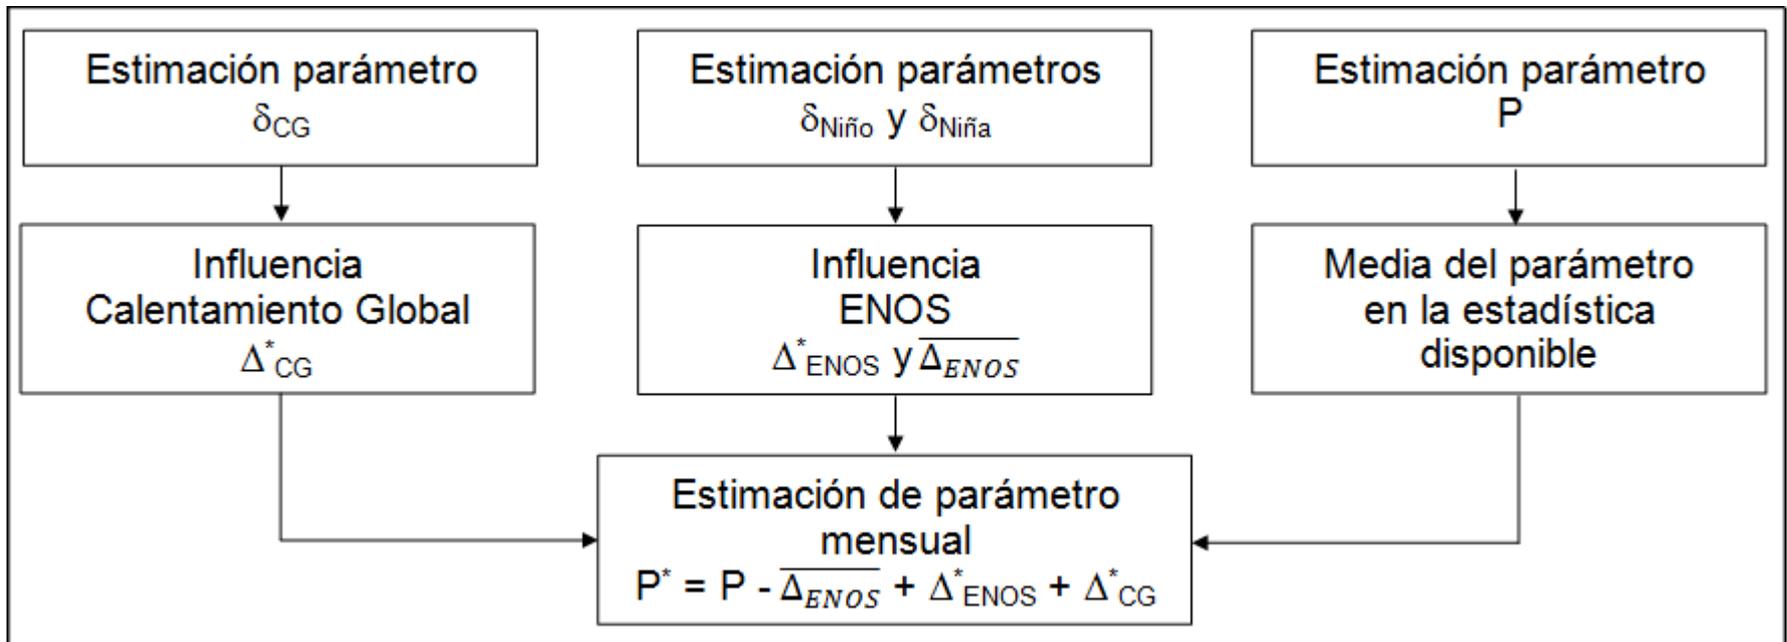

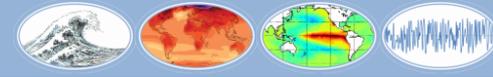

—•— Promedio mensual   
 — Filtro triangular de 12 meses   
 — GLOTI   
 — Filtro triangular de 5 años (GLOTI)   
 - - - Tendencia parámetro   
 - - - Tendencia GLOTI

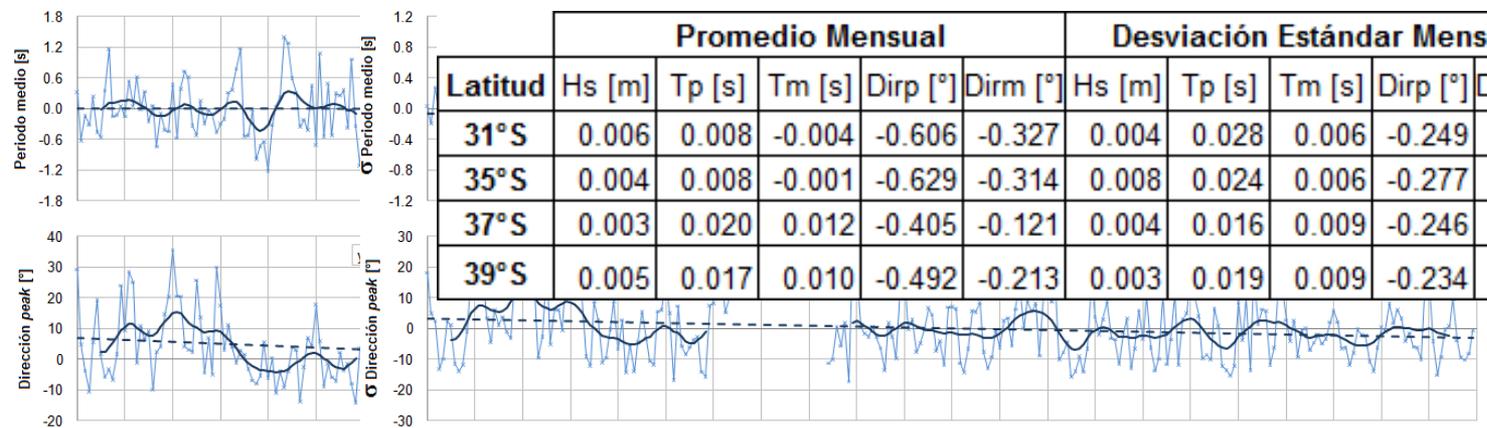

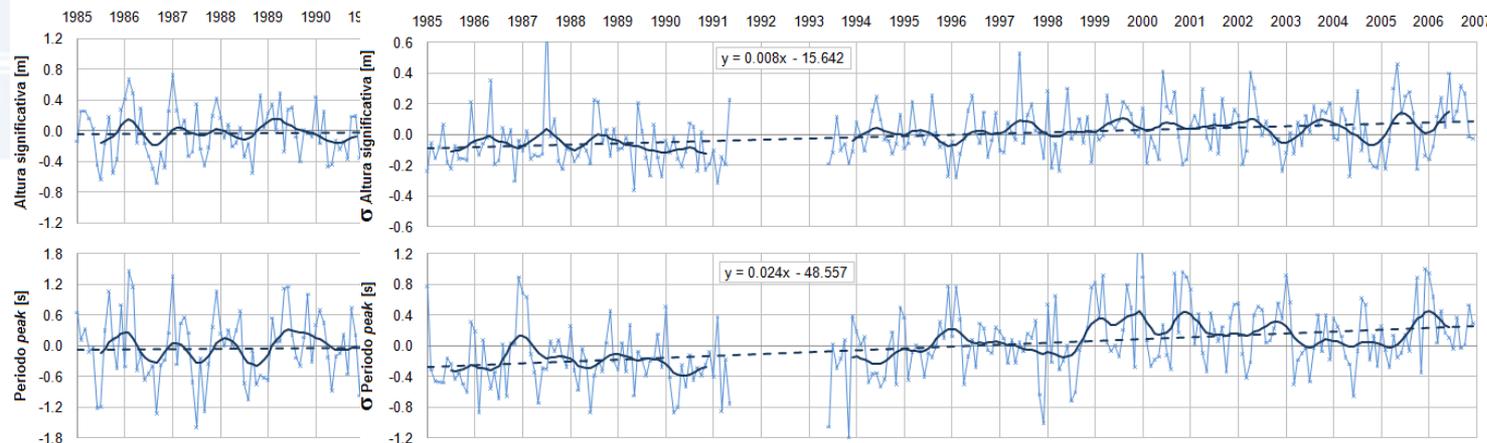

# Resultados:

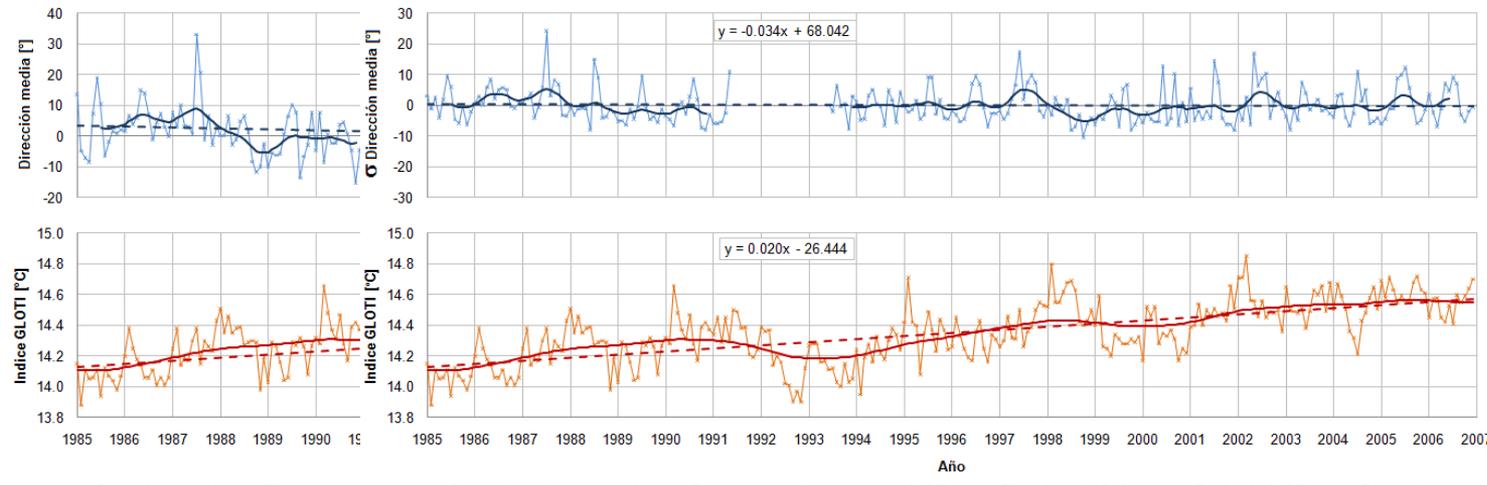

# Influencias en el oleaje

25 años  
Niña extrema

Condición estacionaria Proyección Niña Proyección Normal Proyección Niño

# Conclusiones

- El estudio de oleaje no considera las variaciones por influencias de ENOS y de calentamiento global
- Los fenómenos ENOS y Calentamiento Global influyen el oleaje de manera significativa
- En general, el Calentamiento Global induce aumento de altura y periodo y disminución de la dirección.
- En general ENOS produce disminuciones en los parámetros en la condición Niña y aumentos en la condición Niño, salvo en la altura, donde aumenta en ambo casos.
- Se esperan condiciones futuras de oleaje con aumentos de altura y periodo, pero con dirección que tiende hacia el sur

# Recomendaciones

- Continuar investigando, es un primer paso
- Utilizar estadística medida
- Utilizar información espectral
- Incorporar el análisis de estacionalidades
- Desarrollar estudio para clima extremo
